# SMART CONTRACT CODE REVIEW AND SECURITY ANALYSIS REPORT

Customer: Decubate Date: April 05, 2023

This report may contain confidential information about IT systems and the intellectual property of the Customer, as well as information about potential vulnerabilities and methods of their exploitation.

The report can be disclosed publicly after prior consent by another Party. Any subsequent publication of this report shall be without mandatory consent.

# Document

Name	Smart Contract Code Review and Security Analysis Report for Decubate
Approved By	Paul Fomichov   Lean Smart Contract Auditor at Hacken OU
Туре	ERC20 token
Platform	EVM
Language	Solidity
Methodology	Link
Website	https://www.chaingpt.org/
Changelog	03.04.2023 - Initial Review 03.04.2023 - Second Review

Disclaimers	12

# Introduction

Hacken OÜ (Consultant) was contracted by Decubate (Customer) to conduct a Smart Contract Code Review and Security Analysis. This report presents the findings of the security assessment of the Customer's smart contracts.

# Scope

The scope of the project includes the following smart contracts from the provided repository:

-	٠			•	
Ιn	1	<b>tı</b>	aL	review	scope
	-				

Repository	https://github.com/ChainGPT-org/CGPT_Token
Commit	001b418
Functional Requirements	https://docs.chaingpt.org/overview/iintroduction
Technical Requirements	https://github.com/ChainGPT-org/CGPT_Token/blob/main/readme.md
Contracts	File: ChainGPT.sol SHA3: fef03d5a62e9723cd7250847f53b5cb0e5f8019e8740260d7d9d33e748e66c9e

# Second review scope

Repository	https://github.com/ChainGPT-org/CGPT_Token
Commit	093b8dc
Functional Requirements	https://docs.chaingpt.org/overview/iintroduction
Technical Requirements	https://github.com/ChainGPT-org/CGPT_Token/blob/main/readme.md
Contracts	File: ./ChainGPT.sol SHA3: fef03d5a62e9723cd7250847f53b5cb0e5f8019e8740260d7d9d33e748e66c9e

# Severity Definitions

Risk Level	Description
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to the loss of user funds or contract state manipulation by external or internal actors.
High	High vulnerabilities are usually harder to exploit, requiring specific conditions, or have a more limited scope, but can still lead to the loss of user funds or contract state manipulation by external or internal actors.
Medium	Medium vulnerabilities are usually limited to state manipulations but cannot lead to asset loss. Major deviations from best practices are also in this category.
Low	Low vulnerabilities are related to outdated and unused code or minor Gas optimization. These issues won't have a significant impact on code execution but affect code quality

# Executive Summary

The score measurement details can be found in the corresponding section of the <u>scoring methodology</u>.

## Documentation quality

The total Documentation Quality score is 10 out of 10.

- Functional requirements are provided and complete.
- Technical description is provided and complete.

## Code quality

The total Code Quality score is 10 out of 10.

• The development environment is configured.

#### Test coverage

Code coverage of the project is 0% (branch coverage).

• Tests are not provided.

#### Security score

As a result of the audit, the code contains **1** low severity issue. The security score is **10** out of **10**.

All found issues are displayed in the "Findings" section.

#### Summary

According to the assessment, the Customer's smart contract has the following score: **10**.

1	2	3	4	5	6	7	8	9	10
							~· ]		1

The final score 💻

Table. The distribution of issues during the audit

Review date	Low	Medium	High	Critical
03 April 2023	2	0	0	0
05 April 2023	1	0	0	0

# System Overview

The CGPT token is a utility token that is used to access various AI tools and products powered by ChainGPT. It plays a significant role in the ChainGPT ecosystem as it is required for users to access certain features and services within the platform. Users can obtain CGPT tokens through exchanges where it is listed or by participating in the ChainGPT token sale events.

The repository is composed by a single ERC20 contract:

• ChainGPT - simple ERC-20 token that mints all initial supply to a deployer. Additional minting is not allowed.

It has the following attributes:

- Name: ChainGPT
- Symbol: CGPT
- Decimals: 18
- Total supply: 1b tokens.

## Privileged roles

• The contract inherits Ownable, the deployer gets set as owner.

# Checked Items

We have audited the Customers' smart contracts for commonly known and specific vulnerabilities. Here are some items considered:

Item	Туре	Description	Status	
Default Visibility	<u>SWC-100</u> SWC-108	Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.	Passed	
Integer Overflow and Underflow	<u>SWC-101</u>	If unchecked math is used, all math operations should be safe from overflows and underflows.	Not Relevant	
Outdated Compiler Version	<u>SWC-102</u>	It is recommended to use a recent version of the Solidity compiler.	Passed	
Floating Pragma	<u>SWC-103</u>	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.	Passed	
Unchecked Call Return Value	<u>SWC-104</u>	The return value of a message call should be checked.	Not Relevant	
Access Control & Authorization	<u>CWE-284</u>	Ownership takeover should not be possible. All crucial functions should be protected. Users could not affect data that belongs to other users.	Passed	
SELFDESTRUCT Instruction	<u>SWC-106</u>	The contract should not be self-destructible while it has funds belonging to users.	Not Relevant	
Check-Effect- Interaction	<u>SWC-107</u>	Check-Effect-Interaction pattern should be followed if the code performs ANY external call.	Passed	
Assert Violation	<u>SWC-110</u>	Properly functioning code should never reach a failing assert statement.	Passed	
Deprecated Solidity Functions	<u>SWC-111</u>	Deprecated built-in functions should never be used.	Passed	
Delegatecall to Untrusted Callee	<u>SWC-112</u>	Delegatecalls should only be allowed to trusted addresses.	Not Relevant	
DoS (Denial of Service)	<u>SWC-113</u> SWC-128	Execution of the code should never be blocked by a specific contract state unless required.	Passed	

Race Conditions	<u>SWC-114</u>	Race Conditions and Transactions Order Dependency should not be possible.	Passed	
Authorization through tx.origin	<u>SWC-115</u>	tx.origin should not be used for authorization.	Not Relevant	
Block values as a proxy for time	<u>SWC-116</u>	Block numbers should not be used for time calculations.	Not Relevant	
Signature Unique Id	<u>SWC-117</u> <u>SWC-121</u> <u>SWC-122</u> <u>EIP-155</u> <u>EIP-712</u>	Signed messages should always have a unique id. A transaction hash should not be used as a unique id. Chain identifiers should always be used. All parameters from the signature should be used in signer recovery. EIP-712 should be followed during a signer verification.	ld always have a tion hash should not id. Chain lways be used. All signature should be ery. EIP-712 should signer	
Shadowing State Variable	<u>SWC-119</u>	State variables should not be shadowed.	Passed	
Weak Sources of Randomness	<u>SWC-120</u>	Random values should never be generated from Chain Attributes or be predictable.	Not Relevant	
Incorrect Inheritance Order	<u>SWC-125</u>	When inheriting multiple contracts, especially if they have identical functions, a developer should carefully Pa specify inheritance in the correct order.		
Calls Only to Trusted Addresses	EEA-Lev el-2 SWC-126	All external calls should be performed only to trusted addresses.	Not Relevant	
Presence of Unused Variables	<u>SWC-131</u>	The code should not contain unused variables if this is not <u>justified</u> by design.	Passed	
EIP Standards Violation	EIP	EIP standards should not be violated.	Not Relevant	
Assets Integrity	Custom	Funds are protected and cannot be withdrawn without proper permissions or be locked on the contract.	be sions or Passed	
User Balances Manipulation	Custom	Contract owners or any other third party should not be able to access funds belonging to users.	Passed	
Data Consistency	Custom	Smart contract data should be consistent all over the data flow.	Passed	

Flashloan Attack	Custom	When working with exchange rates, they should be received from a trusted source and not be vulnerable to short-term rate changes that can be achieved by using flash loans. Oracles should be used.	Not Relevant
Token Supply Manipulation Custom		Tokens can be minted only according to rules specified in a whitepaper or any other documentation provided by the Customer.	Passed
Gas Limit and Loops Custom		Transaction execution costs should not depend dramatically on the amount of data stored on the contract. There should not be any cases when execution fails due to the block Gas limit.	Not Relevant
Style Guide Violation	Custom	Style guides and best practices should be followed.	Passed
Requirements Compliance	Custom	The code should be compliant with the requirements provided by the Customer.	Passed
Environment Consistency Custom		The project should contain a configured development environment with a comprehensive description of how to compile, build and deploy the code.	Passed
Secure Oracles Usage	Custom	The code should have the ability to pause specific data feeds that it relies on. This should be done to protect a contract from compromised oracles.	Not Relevant
Tests Coverage	Custom	The code should be covered with unit tests. Test coverage should be sufficient, with both negative and positive cases covered. Usage of contracts by multiple users should be tested.	Failed
Stable Imports	Custom	The code should not reference draft contracts, which may be changed in the future.	Passed

# Findings

## Example Critical

No critical severity issues were found.

#### High

No high severity issues were found.

#### Medium

No medium severity issues were found.

#### Low

#### L01. Floating Pragma

The project uses a floating pragma version.

This may result in the contracts being deployed using the wrong pragma version, which is different from the one they were tested with. For example, they might be deployed using an outdated pragma version which may include bugs that affect the system negatively.

Path: ./ChainGPT.sol

**Recommendation**: Consider locking the pragma version whenever possible and avoid using a floating pragma in the final deployment. Consider known bugs (<u>https://github.com/ethereum/solidity/releases</u>) for the compiler version that is chosen.

Found in: 001b418

Status: Fixed (Revised commit: 093b8dc)

#### L02. Redundant Ownable

The contract inherits OpenZeppelin's Ownable, but there is no way to use its functionalities.

Path: ./ChainGPT.sol

Recommendation: Remove unused Ownable contract.

**Found in:** 001b418

Status: Reported

# Disclaimers

#### Hacken Disclaimer

The smart contracts given for audit have been analyzed based on best industry practices at the time of the writing of this report, with cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report (Source Code); the Source Code compilation, deployment, and functionality (performing the intended functions).

The report contains no statements or warranties on the identification of all vulnerabilities and security of the code. The report covers the code submitted and reviewed, so it may not be relevant after any modifications. Do not consider this report as a final and sufficient assessment regarding the utility and safety of the code, bug-free status, or any other contract statements.

While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only — we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts.

English is the original language of the report. The Consultant is not responsible for the correctness of the translated versions.

## Technical Disclaimer

Smart contracts are deployed and executed on a blockchain platform. The platform, its programming language, and other software related to the smart contract can have vulnerabilities that can lead to hacks. Thus, the Consultant cannot guarantee the explicit security of the audited smart contracts.
