# SMART CONTRACT CODE REVIEW AND SECURITY ANALYSIS REPORT

**Customer:** Playaverse

**Date:** December 13, 2023

This report may contain confidential information about IT systems and the intellectual property of the Customer, as well as information about potential vulnerabilities and methods of their exploitation.

The report can be disclosed publicly after prior consent by another Party. Any subsequent publication of this report shall be without mandatory consent.

## Document

<b>Name</b>	Smart Contract Code Review and Security Analysis Report for Playaverse
<b>Approved By</b>	Marcin Ugarenko   Lead Solidity SC Auditor at Hacken OU
<b>Type</b>	ERC20 token
<b>Platform</b>	EVM
<b>Language</b>	Solidity
<b>Methodology</b>	<a href="#">Link</a>
<b>Website</b>	<a href="https://www.playaverse.app">https://www.playaverse.app</a>
<b>Changelog</b>	04.12.2023 - Initial Review 13.12.2023 - Second Review

## Table of contents

<b>Introduction</b>	<b>4</b>
<b>Scope</b>	<b>4</b>
<b>Severity Definitions</b>	<b>5</b>
<b>Executive Summary</b>	<b>6</b>
<b>Risks</b>	<b>7</b>
<b>System Overview</b>	<b>8</b>
<b>Checked Items</b>	<b>9</b>
<b>Findings</b>	<b>12</b>
Critical	12
High	12

L02. Functions That Can Be Declared External	12
L03. Variables That Should Be Declared Constant	12
<b>Disclaimers</b>	<b>14</b>

## Introduction

Hacken OÜ (Consultant) was contracted by Playaverse (Customer) to conduct a Smart Contract Code Review and Security Analysis. This report presents the findings of the security assessment of the Customer's smart contracts.

## Scope

The scope of the project includes review and security analysis of the following smart contracts from the provided repository:

### Initial review scope

<b>Repository</b>	<a href="https://github.com/Playaverse/plv-token">https://github.com/Playaverse/plv-token</a>
<b>Commit</b>	b2931ac020dbe0b2103d9a988a025f7ef178249b
<b>Whitepaper</b>	<a href="#">Link</a>
<b>Functional Requirements</b>	<a href="#">Link</a>
<b>Technical Requirements</b>	<a href="#">Link</a>
<b>Contracts</b>	File: contracts/Playaverse.sol SHA3: afed5cca159af1c8339dabeb7d5de169b4e1cc7f680ef29f5cf8cd330559e361

### Second review scope

<b>Repository</b>	<a href="https://github.com/Playaverse/plv-token">https://github.com/Playaverse/plv-token</a>
<b>Commit</b>	2cc347320ce54e1cd9c5bf707d82142ba3b9333b
<b>Whitepaper</b>	<a href="#">Link</a>
<b>Functional Requirements</b>	<a href="#">Link</a>
<b>Technical Requirements</b>	<a href="#">Link</a>
<b>Contracts</b>	File: contracts/Playaverse.sol SHA3: 2349521b49f0f89e293c6db6ee9e3a3993e3f28cc46665e747abc79952c6a05f

## Severity Definitions

Risk Level	Description
<b>Critical</b>	Critical vulnerabilities are usually straightforward to exploit and can lead to the loss of user funds or contract state manipulation by external or internal actors.
<b>High</b>	High vulnerabilities are usually harder to exploit, requiring specific conditions, or have a more limited scope, but can still lead to the loss of user funds or contract state manipulation by external or internal actors.
<b>Medium</b>	Medium vulnerabilities are usually limited to state manipulations but cannot lead to asset loss. Major deviations from best practices are also in this category.
<b>Low</b>	Low vulnerabilities are related to outdated and unused code or minor Gas optimization. These issues won't have a significant impact on code execution but affect code quality

## Executive Summary

The score measurement details can be found in the corresponding section of the [scoring methodology](#).

### Documentation quality

The total Documentation Quality score is **10** out of **10**.

- Functional requirements are present.
- Technical description is present.

### Code quality

The total Code Quality score is **10** out of **10**.

- The development environment is configured.

### Test coverage

Code coverage of the project is **100%** (branch coverage).

- Deployment and basic user interactions are covered with tests.
- Both positive and negative cases are tested.

### Security score

As a result of the audit, the code contains **no** issues. The security score is **10** out of **10**.

All found issues are displayed in the “Findings” section.

### Summary

According to the assessment, the Customer's smart contract has the following score: **10**.

*Table. The distribution of issues during the audit*

Review date	Low	Medium	High	Critical
04 December 2023	3	0	0	0
13 December 2023	0	0	0	0

## Risks

No potential risks were found.

## System Overview

*Playaverse* is a ERC20 token with the following contract:

- *Playaverse* – an ERC-20 token. No tokens are minted initially. Additional minting is allowed until the maximum supply is reached. It allows users to burn their balance by extending ERC20Burnable. It implements ERC20Permit.

It has the following attributes:

- Name: Playaverse
- Symbol: PLV
- Decimals: 18
- Maximum supply: 100m tokens.

## Privileged roles

- The owner can mint new tokens until reaching the maximum amount of 100 million tokens.

## Recommendations

- The pragma version can be locked on 0.8.9.
- The owner of the contract should be a multisig wallet with at least 3 write policy.

## Checked Items

We have audited the Customers' smart contracts for commonly known and specific vulnerabilities. Here are some items considered:

Item	Type	Description	Status
Default Visibility	<a href="#">SWC-100</a> <a href="#">SWC-108</a>	Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.	Passed
Integer Overflow and Underflow	<a href="#">SWC-101</a>	If unchecked math is used, all math operations should be safe from overflows and underflows.	Not Relevant
Outdated Compiler Version	<a href="#">SWC-102</a>	It is recommended to use a recent version of the Solidity compiler.	Passed
Floating Pragma	<a href="#">SWC-103</a>	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.	Passed
Unchecked Call Return Value	<a href="#">SWC-104</a>	The return value of a message call should be checked.	Not Relevant
Access Control & Authorization	<a href="#">CWE-284</a>	Ownership takeover should not be possible. All crucial functions should be protected. Users could not affect data that belongs to other users.	Passed
SELFDESTRUCT Instruction	<a href="#">SWC-106</a>	The contract should not be self-destructible while it has funds belonging to users.	Not Relevant
Check-Effect-Interaction	<a href="#">SWC-107</a>	Check-Effect-Interaction pattern should be followed if the code performs ANY external call.	Passed
Assert Violation	<a href="#">SWC-110</a>	Properly functioning code should never reach a failing assert statement.	Passed
Deprecated Solidity Functions	<a href="#">SWC-111</a>	Deprecated built-in functions should never be used.	Passed
Delegatecall to Untrusted Callee	<a href="#">SWC-112</a>	Delegatecalls should only be allowed to trusted addresses.	Not Relevant
DoS (Denial of Service)	<a href="#">SWC-113</a> <a href="#">SWC-128</a>	Execution of the code should never be blocked by a specific contract state unless required.	Passed

<b>Race Conditions</b>	<a href="#">SWC-114</a>	Race Conditions and Transactions Order Dependency should not be possible.	Passed
<b>Authorization through tx.origin</b>	<a href="#">SWC-115</a>	tx.origin should not be used for authorization.	Not Relevant
<b>Block values as a proxy for time</b>	<a href="#">SWC-116</a>	Block numbers should not be used for time calculations.	Not Relevant
<b>Signature Unique Id</b>	<a href="#">SWC-117</a> <a href="#">SWC-121</a> <a href="#">SWC-122</a> <a href="#">EIP-155</a> <a href="#">EIP-712</a>	Signed messages should always have a unique id. A transaction hash should not be used as a unique id. Chain identifiers should always be used. All parameters from the signature should be used in signer recovery. EIP-712 should be followed during a signer verification.	Not Relevant
<b>Shadowing State Variable</b>	<a href="#">SWC-119</a>	State variables should not be shadowed.	Passed
<b>Weak Sources of Randomness</b>	<a href="#">SWC-120</a>	Random values should never be generated from Chain Attributes or be predictable.	Not Relevant
<b>Incorrect Inheritance Order</b>	<a href="#">SWC-125</a>	When inheriting multiple contracts, especially if they have identical functions, a developer should carefully specify inheritance in the correct order.	Passed
<b>Calls Only to Trusted Addresses</b>	<a href="#">EEA-Leve1-2</a> <a href="#">SWC-126</a>	All external calls should be performed only to trusted addresses.	Not Relevant
<b>Presence of Unused Variables</b>	<a href="#">SWC-131</a>	The code should not contain unused variables if this is not <a href="#">justified</a> by design.	Passed
<b>EIP Standards Violation</b>	<a href="#">EIP</a>	EIP standards should not be violated.	Passed
<b>Assets Integrity</b>	Custom	Funds are protected and cannot be withdrawn without proper permissions or be locked on the contract.	Passed
<b>User Balances Manipulation</b>	Custom	Contract owners or any other third party should not be able to access funds belonging to users.	Passed
<b>Data Consistency</b>	Custom	Smart contract data should be consistent all over the data flow.	Passed

<b>Flashloan Attack</b>	<b>Custom</b>	When working with exchange rates, they should be received from a trusted source and not be vulnerable to short-term rate changes that can be achieved by using flash loans. Oracles should be used.	Not Relevant
<b>Token Supply Manipulation</b>	<b>Custom</b>	Tokens can be minted only according to rules specified in a whitepaper or any other documentation provided by the customer.	Passed
<b>Gas Limit and Loops</b>	<b>Custom</b>	Transaction execution costs should not depend dramatically on the amount of data stored on the contract. There should not be any cases when execution fails due to the block Gas limit.	Passed
<b>Style Guide Violation</b>	<b>Custom</b>	Style guides and best practices should be followed.	Passed
<b>Requirements Compliance</b>	<b>Custom</b>	The code should be compliant with the requirements provided by the Customer.	Passed
<b>Environment Consistency</b>	<b>Custom</b>	The project should contain a configured development environment with a comprehensive description of how to compile, build and deploy the code.	Passed
<b>Secure Oracles Usage</b>	<b>Custom</b>	The code should have the ability to pause specific data feeds that it relies on. This should be done to protect a contract from compromised oracles.	Not Relevant
<b>Tests Coverage</b>	<b>Custom</b>	The code should be covered with unit tests. Test coverage should be sufficient, with both negative and positive cases covered. Usage of contracts by multiple users should be tested.	Passed
<b>Stable Imports</b>	<b>Custom</b>	The code should not reference draft contracts, which may be changed in the future.	Passed

## Findings

### Critical

No critical severity issues were found.

### High

No high severity issues were found.

### Medium

No medium severity issues were found.

### Low

#### L01. Floating Pragma

Locking the pragma helps ensure that contracts do not accidentally get deployed using, for example, an outdated compiler version that might introduce bugs that affect the contract system negatively.

**Path:** ./contracts/Playaverse.sol

**Recommendation:** Consider locking the pragma version whenever possible and avoid using a floating pragma in the final deployment.

**Found in:** b2931ac020dbe0b2103d9a988a025f7ef178249b

**Status:** Fixed (Revised commit:  
2cc347320ce54e1cd9c5bf707d82142ba3b9333b)

#### L02. Functions That Can Be Declared External

“public” functions that are never called by the contract should be declared “external” to save gas.

**Path:** ./contracts/Playaverse.sol : mint()

**Recommendation:** Change function visibility to external.

**Found in:** b2931ac020dbe0b2103d9a988a025f7ef178249b

**Status:** Fixed (Revised commit:  
2cc347320ce54e1cd9c5bf707d82142ba3b9333b)

#### L03. Variables That Should Be Declared Constant

State variables that do not change their value should be declared constant to save Gas.

**Path:** ./contracts/Playaverse.sol : MAX\_SUPPLY

**Recommendation:** Change variable mutability to constant.

**Found in:** b2931ac020dbe0b2103d9a988a025f7ef178249b

**Status:** Fixed (Revised commit:  
2cc347320ce54e1cd9c5bf707d82142ba3b9333b)

## Disclaimers

### Hacken Disclaimer

The smart contracts given for audit have been analyzed based on best industry practices at the time of the writing of this report, with cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report (Source Code); the Source Code compilation, deployment, and functionality (performing the intended functions).

The report contains no statements or warranties on the identification of all vulnerabilities and security of the code. The report covers the code submitted and reviewed, so it may not be relevant after any modifications. Do not consider this report as a final and sufficient assessment regarding the utility and safety of the code, bug-free status, or any other contract statements.

While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only – we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts.

English is the original language of the report. The Consultant is not responsible for the correctness of the translated versions.

### Technical Disclaimer

Smart contracts are deployed and executed on a blockchain platform. The platform, its programming language, and other software related to the smart contract can have vulnerabilities that can lead to hacks. Thus, the Consultant cannot guarantee the explicit security of the audited smart contracts.
